IX. *An Excretory Duct from the* Glandula Renalis. *Extracted from the* Giornale di Literati *of* Venice, *for the Year* 1719.

THE celebrated Anatomiſt, Signor *Anton Maria Valſalva*, already known by his noble Treatiſe *De Aure humana*, has lately made a conſiderable Diſcovery. He has found the excretory Ducts of the *Glandulæ Renales*, or, *Renes Succenturiati*, which diſcharge themſelves into the Parts of Generation; that is to ſay, into the *Epididymides* in Men, and into the *Ovaria* in Women. He has read a learned Diſſertation relating to this Diſcovery, before the Academy of Sciences in *Bologna*, in which he undertakes to prove, that thoſe *Renes ſuccenturiati*, are to be reckon'd among the principal Organs of Generation. He is ſoon to publiſh it in Print, but the Publication of the Cuts belonging to it, will be retarded, becauſe the engraving of them, cannot be finiſh'd in ſo ſhort a time.

We have ſince learn'd the diſagreeable News of the Death of this very learned and inquiſitive Anatomiſt; but, as his Reputation, and known Accuracy in diſſecting, leaves no room to doubt of the reality of the abovemention'd Diſcovery, we hope it will be proſecuted by other curious Perſons.
